Imperial College London

18<sup>th</sup> April 2016

# Outline

- Nektar++: brief overview and motivation
- Goals and structure
- Examples
- Conclusions

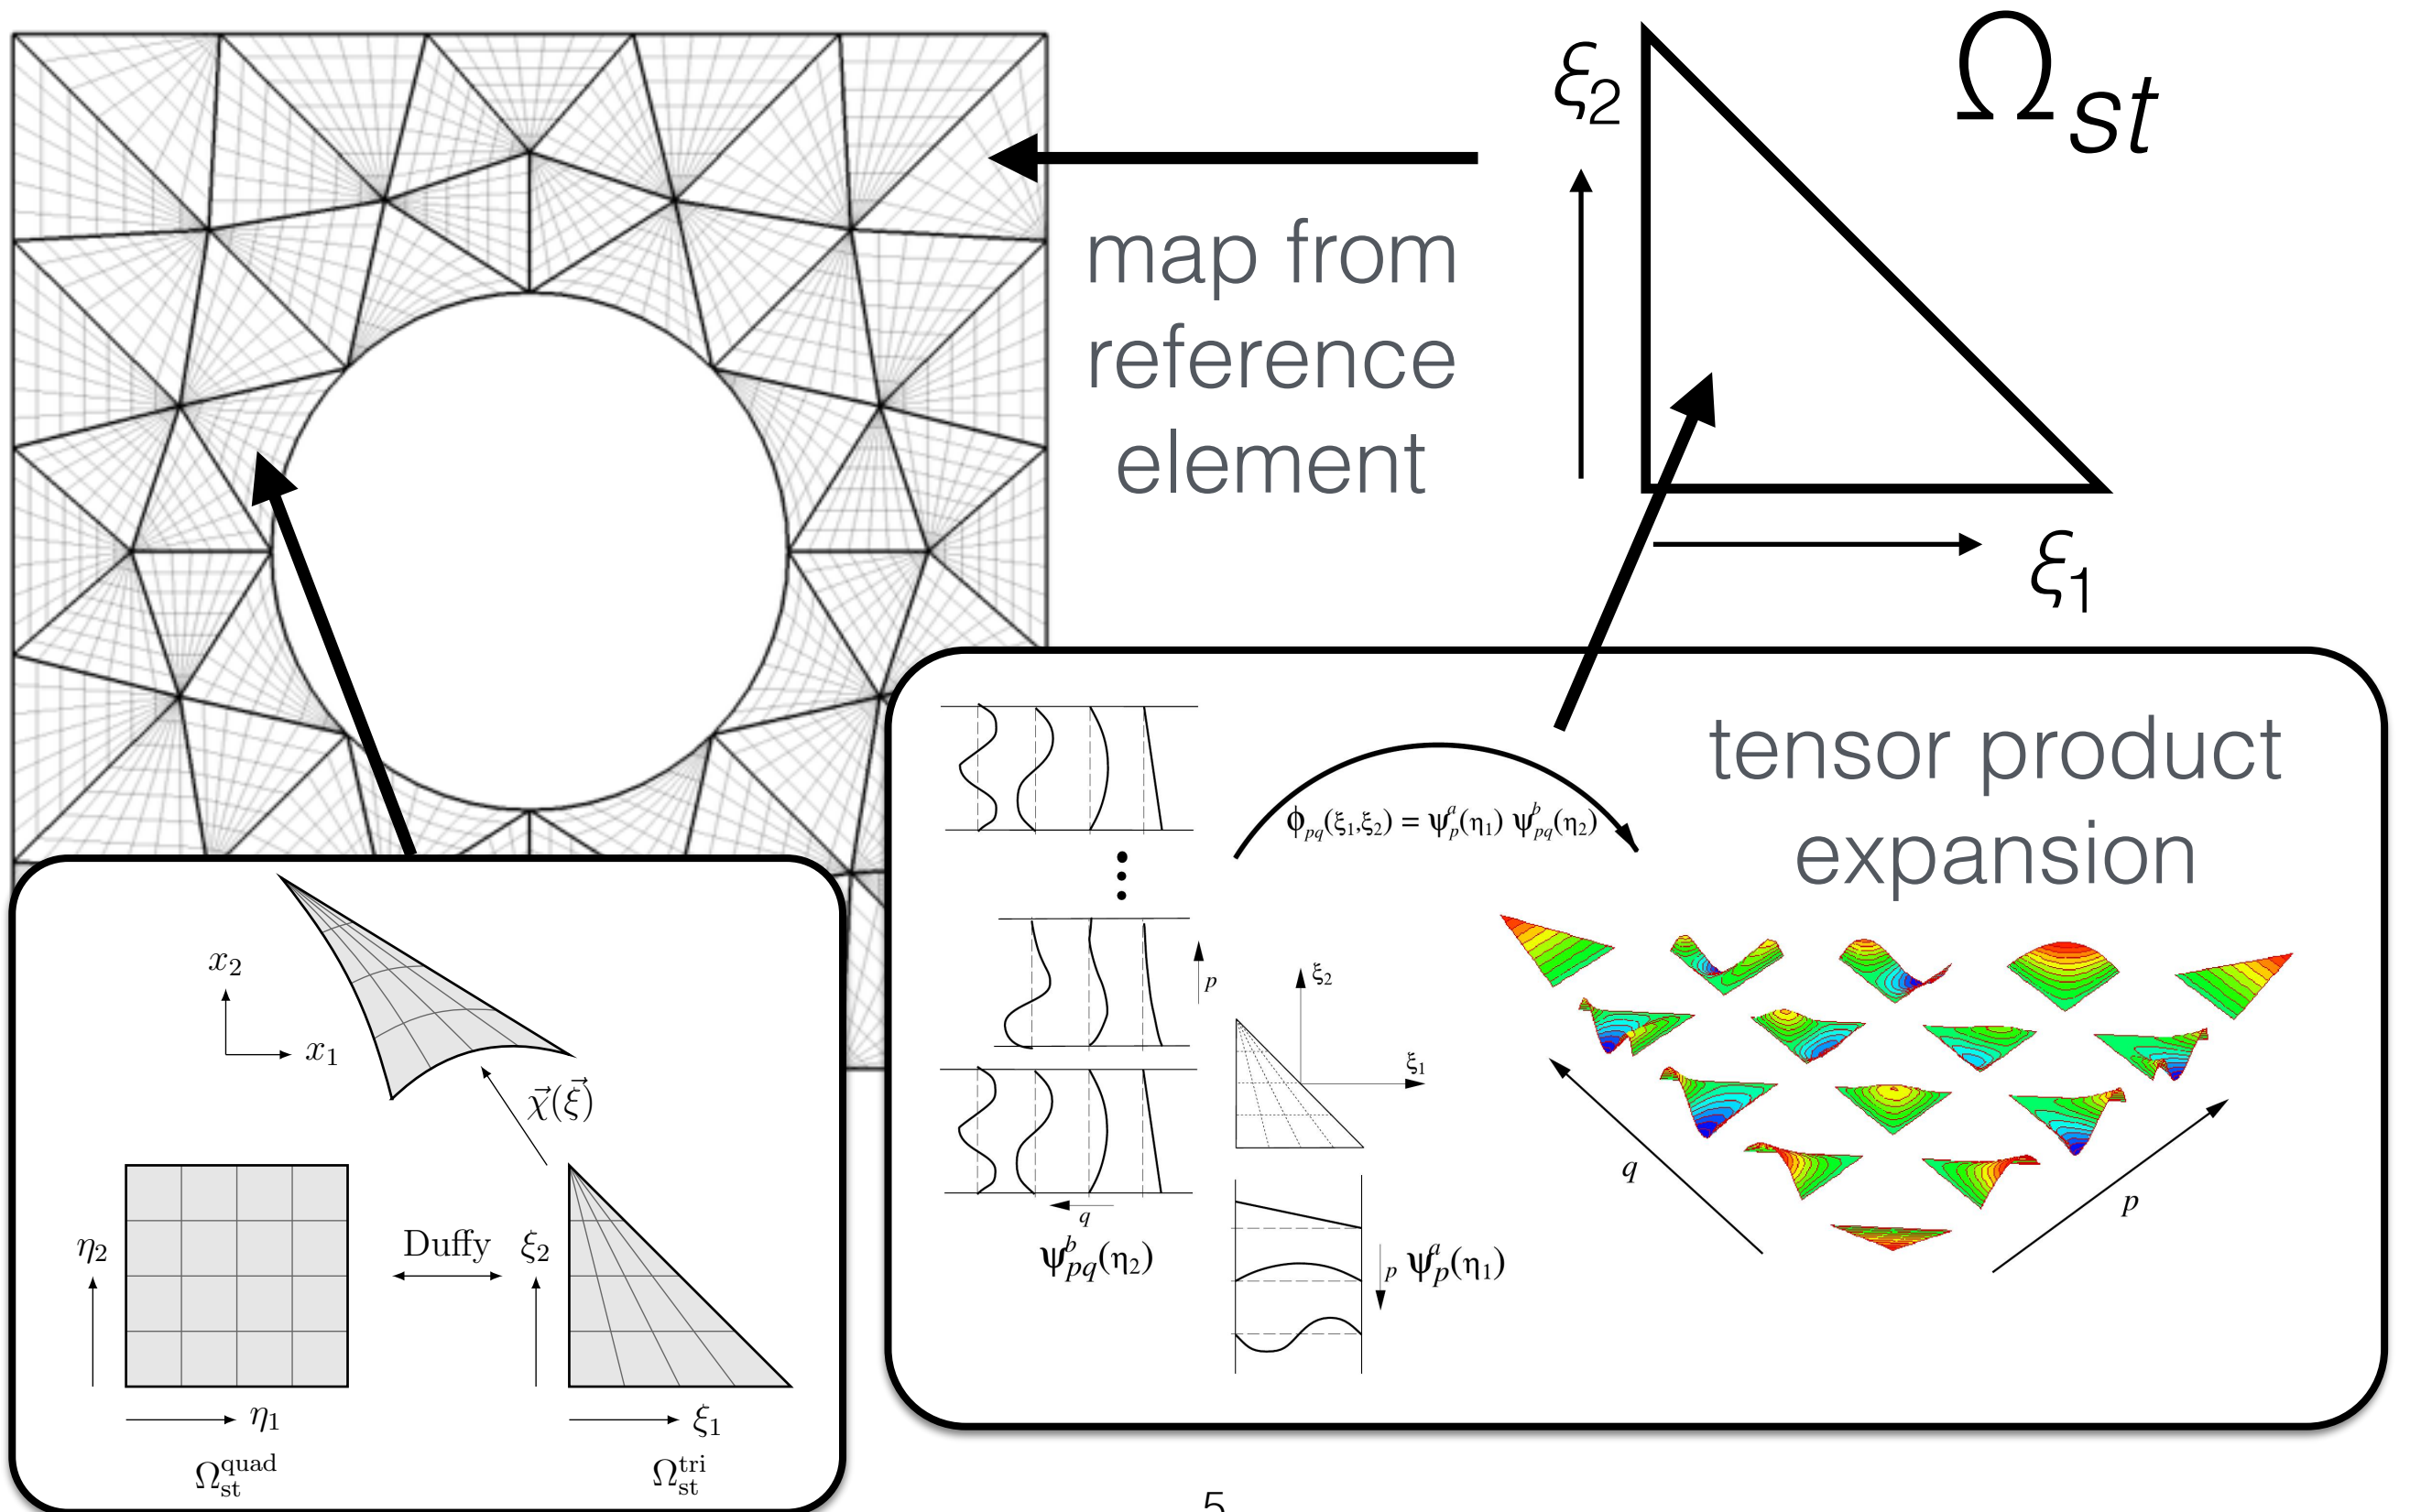

# Nektar++ goals

- Make it simpler/quicker to develop solvers for a range of fields and applications
- Support 1/2/3D and unstructured hybrid meshes for complex geometries
- Scale to large numbers of processors
- Be efficient across a range of polynomial orders and core counts
- Bridge current and future hardware diversity

# Spectral/*hp* element method

# Motivation

Consider the Helmholtz equation:

$$\Delta u + \lambda u = f$$

Put it into weak form:

$$-(\nabla u, \nabla v) + \lambda(u, v) + (\nabla u, v)|_{\partial\Omega} = (f, v)$$

Expand  $u$  and  $v$  in terms of **local** modes (on each element) or **global** modes (on whole mesh):

$$u_e^\delta = \sum_p \hat{u}_p \phi_p(x)$$

$$u^\delta = \sum_i \hat{u}_i \Phi_i(x)$$

# Framework design

$$u^\delta = \sum_i \hat{u}_i \Phi_i(x)$$

$$u_e^\delta = \sum_p \hat{u}_p \phi_p(x)$$

**MultiRegions**

**LocalRegions**

**SpatialDomains**

$$\mathbf{x} = \chi^e(\xi)$$

$$\frac{\partial x_i}{\partial \xi_j} \quad \frac{\partial \xi_i}{\partial x_j}$$

$f[\cdot]$

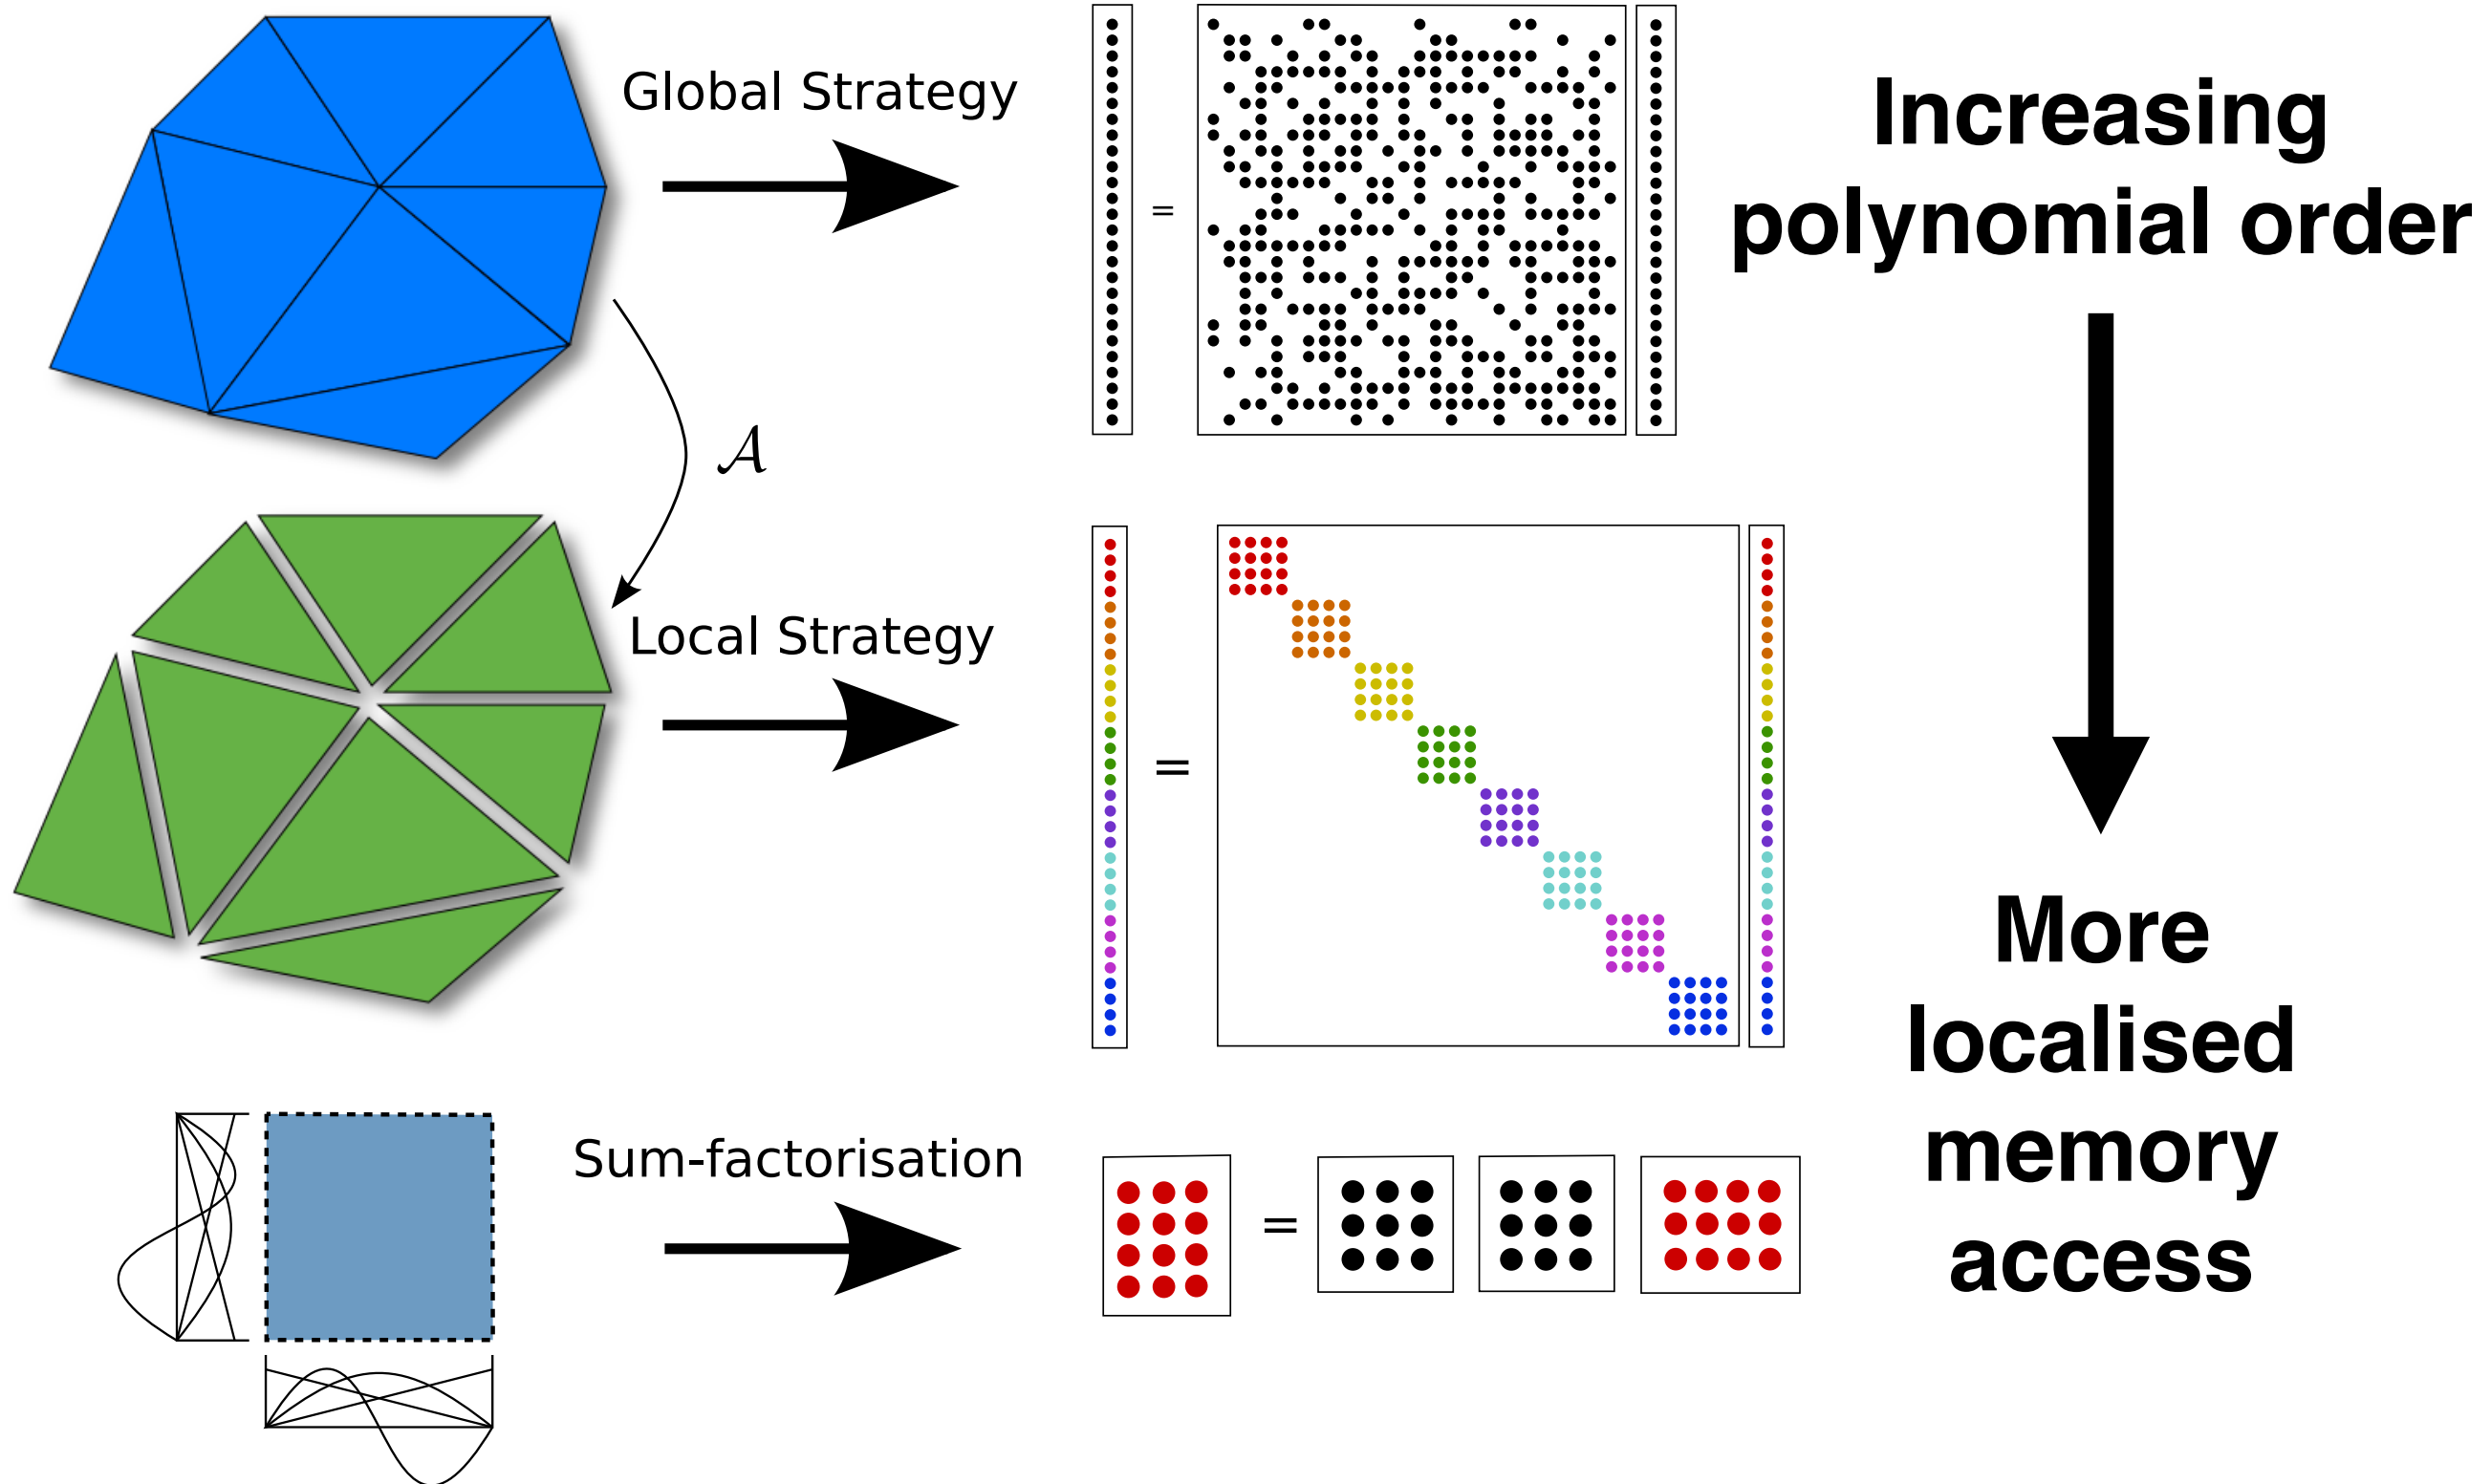

$f[\cdot]$

**StdRegions**

# Implementation choices

# Local approaches

- These approaches give different performance results depending on variety of factors (element type, polynomial order, machine specifications...)
- Also very flexible in terms of development and allowing more advanced features (e.g. adaptivity)
- But performance is not optimal (and implementation not easy) when looking to accelerator hardware
- Needs better control over memory management

# Collections

- **Main idea:** Reformulate implementation choices in terms of groups of elements
- Group geometric terms  $\frac{\partial x_i}{\partial \xi_j}$  and apply to entire mesh
- Focus around key operators of different complexities:
  - ➔ Backward transformation:  $u_e^\delta = \sum_p \hat{u}_p \phi_p(x)$
  - ➔ Inner product:  $(\Phi_i, \Phi_j)$
  - ➔ Derivatives:  $\partial u / \partial x_i$
  - ➔ Inner product w.r.t. derivative:  $(\Phi_i, \nabla \Phi_j)$

# Collections

$$u^\delta = \sum_i \hat{u}_i \Phi_i(x)$$

$$u_e^\delta = \sum_p \hat{u}_p \phi_p(x)$$

**MultiRegions**

**LocalRegions**

**SpatialDomains**

$$\mathbf{x} = \chi^e(\xi)$$

$$\frac{\partial x_i}{\partial \xi_j} \quad \frac{\partial \xi_i}{\partial x_j}$$

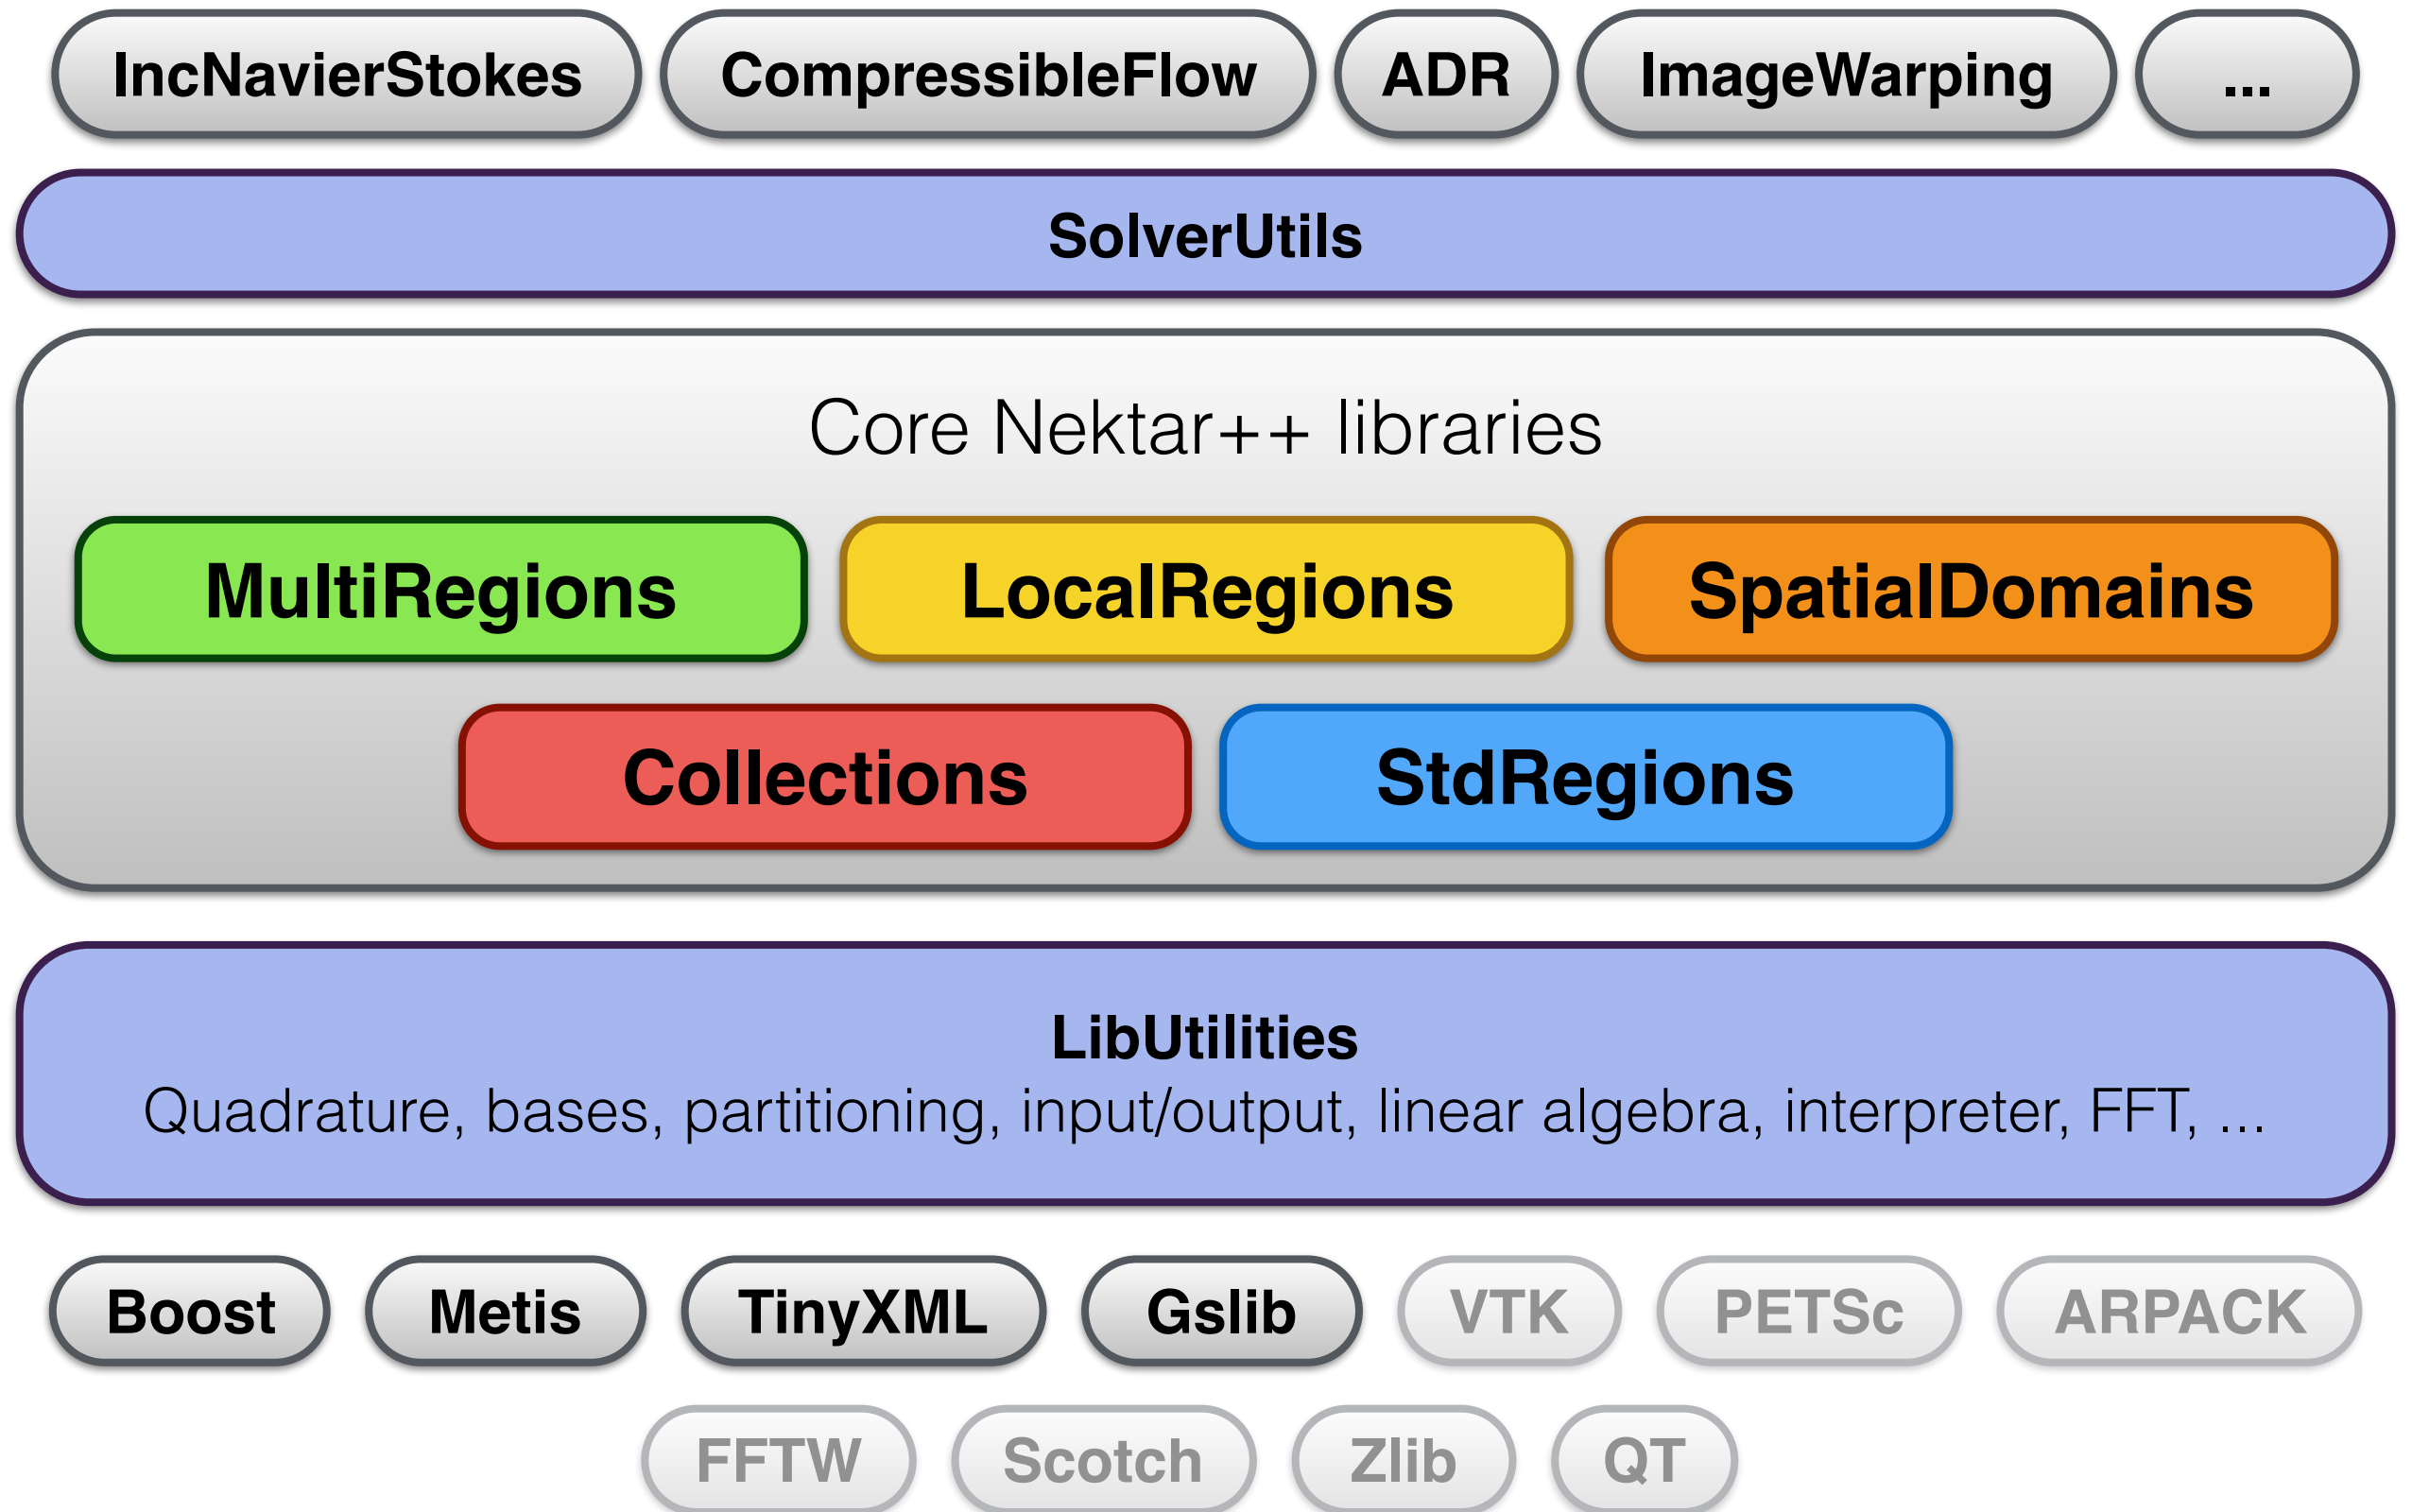

**Collections**

**StdRegions**

# Framework design

# Schemes

## Local Matrix

## StdMat (standard matrix)

1. Apply Jacobian (**L1**)

2. Multiply by ref. matrix (**L3**)

## IterPerExp

1. Apply Jacobian (**L1**)

2. Multiply by ref. matrix (**N x L2**)

for  $i = 1:N$

## SumFac

1. Apply Jacobian (**L1**)

2. Mult. first dimension (**L3**)

3. Mult. second dimension (**N x L2**)

for  $i = 1:N$

# Collections

Use BLAS calls throughout

4 quad mesh

*StdMat*:

$$\mathbf{M} \begin{bmatrix} \bullet & \bullet & \bullet & \bullet \\ \bullet & \bullet & \bullet & \bullet \\ \bullet & \bullet & \bullet & \bullet \\ \bullet & \bullet & \bullet & \bullet \\ \bullet & \bullet & \bullet & \bullet \\ \bullet & \bullet & \bullet & \bullet \end{bmatrix} \hat{\mathbf{U}}_{[N_{\text{dof}}]} \begin{bmatrix} \bullet & \bullet & \bullet & \bullet \\ \bullet & \bullet & \bullet & \bullet \\ \bullet & \bullet & \bullet & \bullet \\ \bullet & \bullet & \bullet & \bullet \end{bmatrix}$$

dgemm

dgemm

*SumFac*:

$$\mathbf{B}_1 \begin{bmatrix} \bullet & \bullet \\ \bullet & \bullet \\ \bullet & \bullet \end{bmatrix} \begin{bmatrix} \bullet & \bullet & \bullet & \bullet & \bullet & \bullet & \bullet & \bullet \\ \bullet & \bullet & \bullet & \bullet & \bullet & \bullet & \bullet & \bullet \\ \bullet & \bullet & \bullet & \bullet & \bullet & \bullet & \bullet & \bullet \end{bmatrix} +$$

$$\begin{bmatrix} \bullet & \bullet \\ \bullet & \bullet \\ \bullet & \bullet \end{bmatrix}, \begin{bmatrix} \bullet & \bullet \\ \bullet & \bullet \\ \bullet & \bullet \end{bmatrix}, \begin{bmatrix} \bullet & \bullet \\ \bullet & \bullet \\ \bullet & \bullet \end{bmatrix}, \begin{bmatrix} \bullet & \bullet \\ \bullet & \bullet \\ \bullet & \bullet \end{bmatrix} \mathbf{B}_2^\top \begin{bmatrix} \bullet & \bullet & \bullet \\ \bullet & \bullet & \bullet \end{bmatrix}$$

4 x dgemv

Intercostal pair

**21k prisms**

41k tets

# Test case

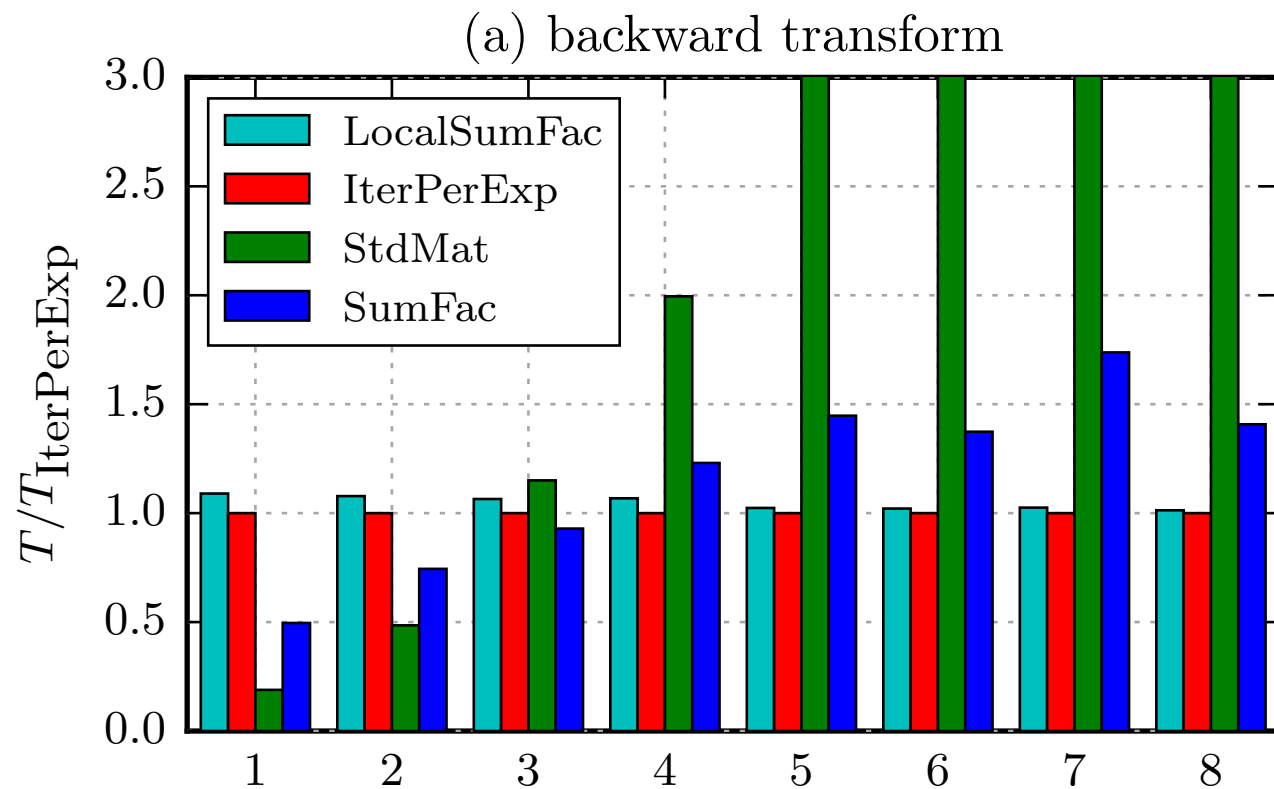

# Performance overview

- *StdMat* tends to be most effective at lower orders
- Collections are less effective at high-order
  - Expected behaviour: matrices are very large for 3D elements - different story in 2D
- PhysDeriv benefits from *SumFac* even at very low polynomial orders
- Similar trends for tetrahedra, but cross-over points are different

# Towards better performance

Reference BLAS

OpenBLAS

Clearly get a different picture!

# Autotuning

- It's somewhat obvious that BLAS choice is very important, but lots of other factors:
  - ➔ machine-specific effects (processor frequency, cache, memory bandwidth/bus speed, ...)
  - ➔ different element types on each processor
- We therefore use a simple auto-tuning strategy at runtime
  - ➔ Every processor runs each implementation type for each operator at startup for 1 second each
  - ➔ Typically takes about 15-20 seconds
- Very simple but effective in selecting optimal scheme

# Example: ONERA M6 wing

improvement: 40-60%

Compressible Euler flow

Fully explicit,  $P = 2$ , 960 cores,  $\sim 150$ k tets

Inner product w.r.t derivative very important

# Insight into performance

- What determines performance?
- Examine hardware counters (core/uncore)
- Using Intel Performance Counter Monitor
- Intel i7-5960K system
- Still somewhat of a work in progress

# Insight into performance

**Low  $P$ : smaller matrices** *StdMat* uses flops more effectively, operation count comparable to sum factorisation

**High  $P$ : larger matrices,** *SumFac* uses memory bandwidth more effectively in combination with lower operation count

# Summary

- Collections speed up our code in fully explicit problems and explicit parts of implicit solvers
- Different schemes allow us to explore wider range of flop/byte space
- Auto-tuning important - maybe a little simplistic
- Inroad into using accelerators in a flexible manner
- Implicit solvers require different approach

Thanks for listening!
